

Two remarks on Inverse Problems

G. Chavent,.

July 23, 2012

In a first part, we address the theoretical problem of the projection on non-convex sets, and show that the the class of quasi-convex sets essentially coincides with that of p-convex sets. In the second part, we adapt the refinement indicators approach to the determination of fractures (barrier or faults) in porous media. Preliminary numerical results show the feasibility of the method.

The author is indebted to F. Clément, V. Martin, H. Benameur, J. Roberts, and C. Fatma for the numerical implementation and many constructive remarks.
