

# Iterative regularization for nonsmooth inverse problems

Christian Clason Vu Huu Nhu

Fakultät für Mathematik, Universität Duisburg-Essen

International Congress on Industrial and Applied Mathematics Valencia, July 17, 2019

# Motivation

#### Inverse problem: find

• unknown parameter  $u^{\dagger}$ 

e.g., heat source, diffusion constant, thermal conductivity, heat capacity, latent heat density, ...

#### given

- measurement y
- model  $S: u \mapsto y$ , e.g., solution of PDE

ightarrow solve

$$S(u) = y$$

Problem: measurement  $y = y^{\delta}$  noisy, range of S not closed  $\rightarrow$  ill-posed, needs regularization

Solve approximate, stable problem:

- 1 Tikhonov regularization  $\rightsquigarrow$  optimal control
- 2 iterative regularization, e.g., Landweber iteration

$$u_{n+1} = u_n + w_n S'(u_n)^* (y^{\delta} - S(u_n))$$
  $n = 1, ..., N$ 

- S'(u) Fréchet derivative,  $S'(u)^*$  adjoint
- stopping index  $N = N(\delta) < \infty$  regularization parameter
- regularization:  $N(\delta) \to \infty$ ,  $u_{N(\delta)} \to u^{\dagger}$  for  $\delta \to 0$

Here: S solution operator for non-smooth PDE

 $\rightsquigarrow$  not Fréchet differentiable

#### 1 Motivation

- 2 Non-smooth equation
- 3 Bouligand-Landweber iteration
- 4 Bouligand-Levenberg-Marquardt iteration
- 5 Numerical examples

$$-\Delta y + \max(0, y) = u$$

solution operator  $S: u \mapsto y$  (:= S(u))

- well-posed (in suitable standard spaces)
- Lipschitz continuous
- completely continuous (~> ill-posed)
- **not** Fréchet differentiable unless  $|\{x : y(x) = 0\}| = 0$
- model for membrane under water
- can be extended to arbitrary f(y) piecewise differentiable
- simplified model for sharp phase transition (Stefan problem)

$$-\Delta y + \max(0, y) = u$$

solution operator  $S: u \mapsto y$  (:= S(u))

- **not** Fréchet differentiable unless  $|\{x : y(x) = 0\}| = 0$
- but: directionally differentiable

Directional derivative  $S'(u; h) =: \eta$  solves

$$-\Delta \eta + \mathbb{1}_{\{y=0\}} \max(0,\eta) + \mathbb{1}_{\{y>0\}} \eta = h$$

#### not linear in $h \rightarrow$ not useful for algorithm

#### Bouligand subdifferential

$$\partial_B S(u) := \begin{cases} G \text{ linear} \\ u_n \to u \text{ and } S'(u_n; h) \to G h \text{ for all } h \end{cases}$$

$$-\Delta \eta + \mathbb{1}_{\{y>0\}}\eta = h$$

 $G_u: h \mapsto \eta$ 

- $G_u \in \partial_B S(u)$  Bouligand derivative [Christof/Meyer/Walter/C.]
- $u \mapsto G_u$  uniformly bounded (in right spaces)
- linear  $\rightsquigarrow$  use for Landweber in place of S'(u)

- 1 Motivation
- 2 Non-smooth equation
- 3 Bouligand-Landweber iteration
- 4 Bouligand-Levenberg-Marquardt iteration
- 5 Numerical examples

$$u_{n+1}^{\delta} = u_n^{\delta} + w_n G_{u_n^{\delta}}^* \left( y^{\delta} - S(u_n^{\delta}) \right), \quad n = 0, 1, 2, \dots, N(\delta)$$

- $S: u \mapsto y$  non-smooth
- $y^{\delta}$  with  $\|y^{\delta} y^{\dagger}\| \leq \delta$ ,  $y^{\dagger} = S(u^{\dagger})$  (assume unique)
- $u_0^{\delta} = u_0$  starting point
- w<sub>n</sub> step sizes
- stopping index  $N(\delta)$  by discrepancy principle:

$$\|y^{\delta} - S(u^{\delta}_{N(\delta)})\|_{Y} \le \tau \delta < \|y^{\delta} - S(u^{\delta}_{n})\|_{Y}, \quad 0 \le n < N(\delta)$$

(modified Landweber iteration [Scherzer '95])

## **Well-posedness**

#### Assume:

- 1  $\{G_u\}$  uniformly bounded
- 2 generalized tangential cone condition (GTCC)

$$||S(u') - S(u) - G_u(u' - u)|| \le \mu ||S(u') - S(u)|| \text{ for all } u, u' \in B_{\rho}(u^{\dagger})$$
  
non-smooth PDE: satisfied for  $1 > \mu > C(|\{x : y^{\dagger}(x) = 0\}|)$   
 $u_0 \in B_{\rho}(u^{\dagger})$ 

Then (under conditions on  $\mu$ ,  $\tau$ ,  $w_n$ ):

$$u_n^{\delta} \in B_{\rho}(u^{\dagger}) \text{ for all } n \leq N(\delta)$$
  

$$\delta > 0: N(\delta) < \infty \text{ and } ||u_n^{\delta} - u^{\dagger}|| < ||u_{n-1}^{\delta} - u^{\dagger}|| \text{ for } n \leq N(\delta)$$
  

$$\delta = 0: N(\delta) = \infty \text{ and } u_n^{0} \to u^{\dagger} \text{ for } n \to \infty$$

Goal: show that 
$$u^{\delta}_{N(\delta)} 
ightarrow u^{\dagger}$$
 for  $\delta 
ightarrow 0$ 

#### Standard proof: combine

- 1 monotonicity:  $\|u_n^{\delta} u^{\dagger}\| < \|u_{n-1}^{\delta} u^{\dagger}\|$  for  $n \le N(\delta)$
- 2 stability:  $u_n^{\delta} \to u_n^0$  for all n = 1, ...

#### Problem:

- stability requires continuity of  $u \mapsto G_u$
- $u \mapsto G_u$  not continuous for S non-smooth
- use asymptotic stability

#### UNIVERSITÄT DUISBURG ESSEN Open-Minded

### Definition

Iterative method generating  $\{u_n^{\delta}\}_{n \le N(\delta)}$  asymptotically stable for  $\delta \to 0$  if exists subsequence  $\{\delta_k\}$  with:

For all  $0 \le n \le \overline{N} := \lim_{k \to \infty} N(\delta_k) \in \mathbb{N} \cup \{\infty\}$ 

$$u_n^{\delta_k} o ilde u_n$$
 as  $k o \infty$ 

for some  $\tilde{u}_n \in \overline{B}_U(u^{\dagger}, \rho)$ 

If  $\overline{N} = \infty$ ,

$$\tilde{u}_n \to u^{\dagger}$$
 as  $n \to \infty$ 

- $\blacksquare$   $\tilde{u}_n$  generated by perturbed noise-free iteration
- perturbation needs to vanish for  $n \to \infty$

Bouligand-Landweber iteration

$$u_{n+1}^{\delta} = u_n^{\delta} + w_n G_{u_n^{\delta}}^* \left( y^{\delta} - S(u_n^{\delta}) \right), \quad n = 0, 1, 2, \dots, N(\delta)$$

 ■ asymptotically stable for non-smooth PDE (proof uses GTCC and compact embedding for R(G<sup>\*</sup><sub>u</sub>))

•  $\rightarrow$  regularization (under conditions on  $\mu, \tau, w_n$ ):

$$u^{\delta}_{N(\delta)} 
ightarrow u^{\dagger}$$
 for  $\delta 
ightarrow 0$ 

- 1 Motivation
- 2 Non-smooth equation
- 3 Bouligand-Landweber iteration
- 4 Bouligand-Levenberg-Marquardt iteration
- 5 Numerical examples

$$u_{n+1}^{\delta} = \operatorname{argmin}_{u \in D(S)} \|S'(u_n^{\delta})(u - u_n^{\delta}) - y^{\delta} - S(u_n^{\delta})\|^2 + \alpha_n \|u - u_n^{\delta}\|^2$$
$$= u_n^{\delta} + \left(\alpha_n I + S'(u_n^{\delta})^* S'(u_n^{\delta})\right)^{-1} S'(u_n^{\delta})^* \left(y^{\delta} - S(u_n^{\delta})\right)$$

$$\alpha_n = \alpha_0 r^n, r < 1$$

stopping by discrepancy principle

TCC + transfer operator property

 $S'(u_2) = Q(u_1, u_2)S'(u_1)$  Q linear, near identity

 $\blacksquare$   $\rightarrow$  stable, convergent regularization

 $\square N(\delta) = O(1 + |\log \delta|)$ 

$$u_{n+1}^{\delta} = \operatorname{argmin}_{u \in D(S)} \|G_{u_n^{\delta}}(u - u_n^{\delta}) - y^{\delta} - S(u_n^{\delta})\|^2 + \alpha_n \|u - u_n^{\delta}\|^2$$
$$= u_n^{\delta} + \left(\alpha_n I + G_{u_n^{\delta}}^* G_{u_n^{\delta}}\right)^{-1} G_{u_n^{\delta}}^* \left(y^{\delta} - S(u_n^{\delta})\right)$$

$$\alpha_n = \alpha_0 r^n, r < 1$$

stopping by discrepancy principle

GTCC + transfer operator property (holds for non-smooth PDE)

$$G_{u_2} = Q(u_1, u_2)G_{u_1}$$
 Q linear, near identity

•  $\rightarrow$  asymptotically stable, convergent regularization •  $N(\delta) = O(1 + |\log \delta|)$ 

- 1 Motivation
- 2 Non-smooth equation
- 3 Bouligand-Landweber iteration
- 4 Bouligand-Levenberg-Marquardt iteration
- 5 Numerical examples

$$-\Delta y + \max(0, y) = u$$

finite element discretization

semismooth Newton method for solution (evaluation of S)

- constructed exact solution  $u^{\dagger}$  with  $|\{x : y^{\dagger}(x) = 0\}| > 0$
- random Gaussian noise:  $||y^{\delta} y^{\dagger}|| = \delta$
- $\mu = 0.1$ ,  $\tau = 1.4$ ,  $\rho = 5$ ,  $w_n = \frac{2-2\mu}{L^2}$ ,  $\bar{L} = 5 \times 10^{-2}$
- compare two starting points:

1  $u_0 \equiv 0$ 

2  $\bar{u}_0$  satisfying  $u^{\dagger} - u_0 \in \mathcal{R}(G^*_{u^{\dagger}})$  (generalized source condition)

# Numerical example: results with $u_0$

# Conclusion

#### Summary

- iterative regularization using Bouligand derivatives
- inverse source problems for non-smooth PDEs
- convergence under asymptotic stability

#### Outlook

- convergence rates under source condition
- accelerated Landweber iteration
- other non-smooth equations, variational inequalities
- coefficient inverse problems
