

Exercise 3: shared memory parallelization using OpenMP

Deadline: Jan 6, 2023, 16:00

Status:

Wednesday 14th December, 2022, 16:21

Supervisor: Prof.Dr. G. Haase,

gundolf.haase@uni-graz.at

We propose to read the OpenMP summary¹ as well as the OpenMP tutorial from LLNL². See also this guide³ by Joel Yliluoma and slides, p.25⁴ by Annika Hagemeier.

Take care that to use the C++ `system_clock`⁵, see example `thread_17`, or the OMP timing routine `omp_get_wtime()` !

1. Download⁶ the template for the inner product of vectors (example II-A). (4 Pkt.)
 - Compile and run it.
 - Try several schedule types and junk sizes in `mylib.cpp:13`, see §4.1 and §2.7.1 in the OpenMP specifications.
 - Calculate the speedup for different number of cores (incl. hyperthreading)
Use function `omp_set_num_threads(tn)` in your main function or call `export OMP_NUM_THREADS=tn` from the shell in order to run the code on `tn` parallel threads.
 - Try `omp_get_wtime()`, `omp_get_num_procs()` and `omp_in_parallel()`.
 - Write a second function `scalar` using a parallel environment `#pragma omp parallel` without `for`.
 - Write a function similar to function `reduction_vec(int n)` that appends the private vectors instead of adding them, see p. 74ff in slides by A. Hagemeier.
2. Parallelize task (B) (Data-IO; means and max/min of vector elements) from Exercise 1. Compare the run time of the OpenMP approach with the execution policies⁷ in C++17. (4 Pkt.)
3. Parallelize example (F) (Goldbach: count [, pairs]) from Exercise 1. (4 Pkt.)
4. Parallelize examples (B)-(D) from Exercise 2. (4 Pkt.)
 - Write in (A) also a parallel function that realizes the summation $s = \sum_{k=0}^{n-1} x_k$.
 - Compare the speedup of the sum as well as the inner product for various $n = 10^k$, $k \in [3, 8]$.
5. Copy your sequential Code for example (E) (code⁸, docu⁹) or (F) (code¹⁰, docu¹¹) from Exercise 2 and parallelize it. (8 Pkt.)
