Mathematical Modelling in the Natural Sciences
SS19, Exercises, Sheet 8

Solutions to be presented on 3. June 2019

1. Write an approximation $\tilde{J}$ to the potential J (on page 172 of the lecture notes) where the necessary optimality condition on a displacement u which minimizes $\tilde{J}$ is given by the Poisson boundary value problem
$$\left\{ \begin{array}{rcll} -\nabla \cdot (T\nabla u) & = & f, & \text{in} \quad \Omega \\ u & = & 0, & \text{on} \quad \partial\Omega \end{array} \right.$$
Here, it is assumed that the membrane with displacement u is clamped at the boundary $\partial\Omega$ of $\Omega = (0,1)^2$. For the chosen potential $\tilde{J}$, show by an explicit derivation that the necessary optimality condition is given by the IBVP above. Solved by Mr. Habring.

2. Write a Matlab code to solve the non-linear boundary value problem
$$\left\{ \begin{array}{rcll} -\nabla \cdot \left(\dfrac{T\nabla u}{\sqrt{1+|\nabla u|^2}} \right) & = & f, & \text{in} \quad \Omega \\ u & = & 0, & \text{on} \quad \partial\Omega \end{array} \right.$$
using a Picard iteration in order to compute the membrane displacement.

3. Write a Matlab code to solve the initial and boundary value problem for the nonlinear wave equation
$$\left\{ \begin{array}{rcll} u_{tt} & = & \nabla \cdot \left(\dfrac{T\nabla u}{\sqrt{1+|\nabla u|^2}} \right), & \text{in} \quad \Omega \times (0,T] \\ u & = & 0, & \text{on} \quad \partial\Omega \times [0,T] \\ u & = & u_0, & \text{on} \quad \Omega \times \{0\} \\ u_t & = & u_1, & \text{on} \quad \Omega \times \{0\} \end{array} \right.$$
Solved by Mr. Stadler.

4. After being well acquainted with the program in the lecture notes for solving the nonlinear wave equation to simulate the motion of a bungee cord, derive the optimality conditions for the membrane counterpart and investigate the steady state anomaly in the following Matlab implementation for the membrane:
